INGEST

CLIENT

U.S. Army, Aberdeen Proving Ground (APG)

- Dramatic speed improvement
- Higher-quality data
- Better reporting
- Far greater flexibility with far less maintenance

Challenge

APG needed a faster and more accurate data collection and reporting system. Its disparate sensor-based systems for analyzing how weather conditions affect performance ? a life and death matter in combat zones ? limited the quality and timeliness of data reporting, and required a disproportionate amount of ongoing maintenance just to remain operational.

Solution

Mind Over Machines re-envisioned how to satisfy APG's data needs and developed INGEST, an integrated system that makes real-time weather data available from hundreds of sources simultaneously and employs a data verification protocol to reduce false alerts.

Results

INGEST's improvements over the legacy system were so dramatic that after just three weeks of testing, APG abandoned its 6-month test plan and fully adopted the new system.
